anxiety problems in children and adolescents

Parents may notice that their child seems nervous or fearful. This may be related to a stressful event, such as performing in a school play or writing an exam. In such situations it is normal for a child to worry or feel nervous. It can even help the child memorize their lines or study longer for a test.

Children or teenagers may have a problem, however, if they are frequently nervous or worried and find it hard to cope with any new situation or challenge. Rather than being just “nervous,” the way they feel is better described as being “anxious.”

Anxiety is defined as a feeling of worry or unease. When the level of anxiety is great enough to interfere with a child or young person’s everyday activities, we call this an Anxiety Disorder. Anxiety disorder is a psychiatric condition that may require medical or psychological treatment.

What’s normal and what’s not?

Being nervous about a single event, such as writing an exam, is normal. Trying to avoid any situation that causes anxiety is not normal and may mean that the child or teen has an anxiety disorder.

Types of Anxiety Disorders

Children and teens can have more than one type of anxiety disorder at the same time. Some types of anxiety disorders are:

- Separation Anxiety Disorder:
- Generalized Anxiety Disorder (GAD):
- Social Phobia:
- Obsessive-Compulsive Disorder (OCD):

In some situations, anxiety may be normal for a younger child but not an older one. One common example is a young child who becomes upset when left alone with a babysitter for the first time. This separation anxiety is a normal reaction for a young child but would not be normal for a teenager. When the symptoms begin in later childhood or adolescence and continue for several weeks then it may be time to seek professional help.
Children and adolescents with this disorder will often repeat behaviors to avoid some imagined outcome. For example, some people who are frightened of germs will wash their hands over and over to avoid catching a disease. These thoughts can also cause a young person a great deal of anxiety. The obsessions and compulsions can take up so much time that the young person can’t lead a normal life.

**Panic Disorder:**
This is a severe type of anxiety disorder. Teenagers, and sometimes children, are likely having a panic attack when they feel very scared or have a hard time breathing and their heart is pounding. They may also feel shaky, dizzy and think they are going to lose their mind or even die. The teen or child may not want to go to school or leave the house at all because they are afraid something awful will happen to them. Frequent panic attacks may mean that they have a panic disorder.

**Post-Traumatic Stress Disorder (PTSD):**
PTSD is fairly rare in children. It usually involves a set of anxiety symptoms that begin after one or many episodes of serious emotional upset. The symptoms include jumpiness, muscle tension, being overly aware of one’s surroundings (hypervigilance), nightmares and other sleep problems.

Children and young people with PTSD sometimes also report feeling like they are “re-living” the traumatic experience. These “flashbacks” often include vivid memories of the triggering event(s), which may involve physical, emotional or sexual abuse.

**Selective Mutism:**
This is a term used to describe the behaviour of some children who do not speak in certain situations while speaking in others. Children with selective mutism have a specific worry about speaking, but only in the situations that make them feel anxious.

Some children may speak only to their parents but not to other adults. When they know they are going to have to speak, these children may blush, look down, or withdraw. When they do communicate in such situations, they may point or use other gestures, or whisper rather than talk.

Up to 2% of school aged children may have the symptoms of selective mutism and the symptoms usually appear when they start daycare or school. Some children may “outgrow” the condition but many go on to have social phobia.

**What treatments are effective?**
Both anti-anxiety medications, such as selective serotonin reuptake inhibitors (SSRIs)—drugs that help regulate brain chemicals, and cognitive behavioural therapy (CBT) have been shown to be effective in the treatment of anxiety disorders in children.

CBT is considered to be the treatment of choice. If an older child or adolescent does not respond completely to CBT, then medications can be added.
